Graphs (review)

Definition. A *directed graph (digraph)* $G = (V, E)$ is an ordered pair consisting of

- a set V of *vertices* (singular: *vertex*),
- a set $E \subseteq V \times V$ of *edges*.

In an *undirected graph* $G = (V, E)$, the edge set E consists of *unordered* pairs of vertices.

In either case, we have $|E| = O(V^2)$. Moreover, if G is connected, then $|E| \geq |V| - 1$, which implies that $\lg |E| = \Theta(\lg V)$.

(Review CLRS, Appendix B.)

February 19, 2009

2

Adjacency-matrix representation

The *adjacency matrix* of a graph $G = (V, E)$, where $V = \{1, 2, \dots, n\}$, is the matrix $A[1 \dots n, 1 \dots n]$ given by

$$A[i, j] = \begin{cases} 1 & \text{if } (i, j) \in E, \\ 0 & \text{if } (i, j) \notin E. \end{cases}$$

February 19, 2009

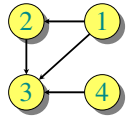

3

Adjacency-matrix representation

The *adjacency matrix* of a graph $G = (V, E)$, where $V = \{1, 2, \dots, n\}$, is the matrix $A[1 \dots n, 1 \dots n]$ given by

$$A[i, j] = \begin{cases} 1 & \text{if } (i, j) \in E, \\ 0 & \text{if } (i, j) \notin E. \end{cases}$$

A	1	2	3	4
1	0	1	1	0
2	0	0	1	0
3	0	0	0	0
4	0	0	1	0

$\Theta(V^2)$ storage
 \Rightarrow *dense* representation.

February 19, 2009

4

Adjacency-list representation

An *adjacency list* of a vertex $v \in V$ is the list $Adj[v]$ of vertices adjacent to v .

February 19, 2009

5

Adjacency-list representation

An *adjacency list* of a vertex $v \in V$ is the list $Adj[v]$ of vertices adjacent to v .

For undirected graphs, $|Adj[v]| = degree(v)$.
For digraphs, $|Adj[v]| = out-degree(v)$.

February 19, 2009

6

Adjacency-list representation

An *adjacency list* of a vertex $v \in V$ is the list $Adj[v]$ of vertices adjacent to v .

For undirected graphs, $|Adj[v]| = degree(v)$.
For digraphs, $|Adj[v]| = out-degree(v)$.

Handshaking Lemma: $\sum_{v \in V} degree(v) = 2|E|$ for undirected graphs \Rightarrow adjacency lists use $\Theta(V + E)$ storage — a *sparse* representation.

February 19, 2009

7

Minimum spanning trees

Input: A connected, undirected graph $G = (V, E)$ with weight function $w : E \rightarrow \mathbb{R}$.

- For simplicity, assume that all edge weights are distinct. (CLRS covers the general case.)

February 19, 2009

8

Minimum spanning trees

Input: A connected, undirected graph $G = (V, E)$ with weight function $w : E \rightarrow \mathbb{R}$.

- For simplicity, assume that all edge weights are distinct. (CLRS covers the general case.)

Output: A *spanning tree* T — a tree that connects all vertices — of minimum weight:

$$w(T) = \sum_{(u,v) \in T} w(u, v).$$

February 19, 2009

9

Example of MST

February 19, 2009

10

Example of MST

February 19, 2009

11

Optimal substructure

MST T :
(Other edges of G
are not shown.)

February 19, 2009

12

Optimal substructure

MST T :
(Other edges of G
are not shown.)

Remove any edge $(u, v) \in T$.

February 19, 2009

13

Optimal substructure

MST T :
(Other edges of G
are not shown.)

Remove any edge $(u, v) \in T$.

February 19, 2009

14

Optimal substructure

MST T :
(Other edges of G
are not shown.)

Remove any edge $(u, v) \in T$. Then, T is partitioned into two subtrees T_1 and T_2 .

February 19, 2009

15

Optimal substructure

MST T :
(Other edges of G
are not shown.)

Remove any edge $(u, v) \in T$. Then, T is partitioned into two subtrees T_1 and T_2 .

Theorem. The subtree T_1 is an MST of $G_1 = (V_1, E_1)$, the subgraph of G induced by the vertices of T_1 :

$$V_1 = \text{vertices of } T_1, \\ E_1 = \{ (x, y) \in E : x, y \in V_1 \}.$$

Similarly for T_2 .

February 19, 2009

16

Proof of optimal substructure

Proof. Cut and paste:

$$w(T) = w(u, v) + w(T_1) + w(T_2).$$

If T'_1 were a lower-weight spanning tree than T_1 for G_1 , then $T' = \{(u, v)\} \cup T'_1 \cup T_2$ would be a lower-weight spanning tree than T for G . \square

February 19, 2009

17

Proof of optimal substructure

Proof. Cut and paste:

$$w(T) = w(u, v) + w(T_1) + w(T_2).$$

If T'_1 were a lower-weight spanning tree than T_1 for G_1 , then $T' = \{(u, v)\} \cup T'_1 \cup T_2$ would be a lower-weight spanning tree than T for G . \square

Do we also have overlapping subproblems?

- Yes.

February 19, 2009

18

Proof of optimal substructure

Proof. Cut and paste:

$$w(T) = w(u, v) + w(T_1) + w(T_2).$$

If T_1' were a lower-weight spanning tree than T_1 for G_1 , then $T' = \{(u, v)\} \cup T_1' \cup T_2$ would be a lower-weight spanning tree than T for G . \square

Do we also have overlapping subproblems?

• Yes.

Great, then dynamic programming may work!

• Yes, but MST exhibits another powerful property which leads to an even more efficient algorithm.

February 19, 2009

19

Hallmark for “greedy” algorithms

Greedy-choice property
A locally optimal choice
is globally optimal.

February 19, 2009

20

Hallmark for “greedy” algorithms

Greedy-choice property
A locally optimal choice
is globally optimal.

Theorem. Let T be the MST of $G = (V, E)$, and let $A \subseteq V$. Suppose that $(u, v) \in E$ is the least-weight edge connecting A to $V - A$. Then, $(u, v) \in T$.

February 19, 2009

21

Proof of theorem

Proof. Suppose $(u, v) \notin T$. Cut and paste.

T :

$\circ \in A$
 $\bullet \in V - A$

(u, v) = least-weight edge connecting A to $V - A$

February 19, 2009

22

Proof of theorem

Proof. Suppose $(u, v) \notin T$. Cut and paste.

T :

$\circ \in A$
 $\bullet \in V - A$

(u, v) = least-weight edge connecting A to $V - A$

Consider the unique simple path from u to v in T .

February 19, 2009

23

Proof of theorem

Proof. Suppose $(u, v) \notin T$. Cut and paste.

T :

$\circ \in A$
 $\bullet \in V - A$

(u, v) = least-weight edge connecting A to $V - A$

Consider the unique simple path from u to v in T .

Swap (u, v) with the first edge on this path that connects a vertex in A to a vertex in $V - A$.

February 19, 2009

24

Proof of theorem

Proof. Suppose $(u, v) \notin T$. Cut and paste.

T' :

$\circ \in A$
 $\bullet \in V - A$

(u, v) = least-weight edge connecting A to $V - A$

Consider the unique simple path from u to v in T .

Swap (u, v) with the first edge on this path that connects a vertex in A to a vertex in $V - A$.

A lighter-weight spanning tree than T results. \square

February 19, 2009

25

Prim's algorithm

IDEA: Maintain $V - A$ as a priority queue Q . Key each vertex in Q with the weight of the least-weight edge connecting it to a vertex in A .

```

Q ← V
key[v] ← ∞ for all v ∈ V
key[s] ← 0 for some arbitrary s ∈ V
while Q ≠ ∅
  do u ← EXTRACT-MIN(Q)
  for each v ∈ Adj[u]
    do if v ∈ Q and w(u, v) < key[v]
       then key[v] ← w(u, v)  ▷ DECREASE-KEY
       π[v] ← u
  
```

At the end, $\{(v, \pi[v])\}$ forms the MST.

MST algorithms

Kruskal's algorithm (see CLRS):

- Uses the **disjoint-set data structure** (see CLRS, Ch. 21).
- Running time = $O(E \lg V)$.

February 19, 2009

51

MST algorithms

Kruskal's algorithm (see CLRS):

- Uses the **disjoint-set data structure** (see CLRS, Ch. 21).
- Running time = $O(E \lg V)$.

Best to date:

- Karger, Klein, and Tarjan [1993].
- Randomized algorithm.
- $O(V + E)$ expected time.
